

Tanzania Coastal Forest Research Programme

Checklist of the Vascular Plants from 13 Coastal Forests in Tanzania

G. P. Clarke

July 1995

**SOCIETY FOR ENVIRONMENTAL EXPLORATION
AND
THE UNIVERSITY OF DAR ES SALAAM**

The Society for Environmental Exploration

The Society is a non-profit company limited by guarantee, founded in 1989. Its objectives are to advance field research into environmental issues and implement practical projects contributing to the conservation of biodiversity and other natural resources. Projects organised by the Society are joint initiatives developed in collaboration with national research agencies in co-operating countries. The Society also promotes co-operation between scientists and technicians from collaborating institutions and counterparts in the UK and elsewhere.

The University of Dar es Salaam

The University of Dar es Salaam was established in July 1970 as a centre for learning and research in the arts and the physical, natural, earth, marine, medical and human sciences. The University is surveying and mapping the flora and fauna of Tanzania and is conducting research into the maintenance and improvement of the environment and the sustainable exploitation of Tanzania's natural resources.

The FRONTIER TANZANIA Project and Series of Reports

The Society and the University have been conducting collaborative research into environmental issues since July 1989, under the title of the Frontier Tanzania Project. The Project has to-date involved over 500 people from both Tanzania and overseas. Field research is being undertaken on a variety of habitats in Tanzania's coastal zone, chosen for their high biological interest and conservation value. Habitats under study include mangroves, coral reefs, coastal forests and savanna. The projects have been developed with the assistance and collaboration of Regional and District Authorities, the Ministry of Tourism, Natural Resources and Environment, Tanzania National Parks and Tanzania Fisheries Research Institute. The findings of the Project are summarised in a series of reports published by the University of Dar es Salaam. More formal scientific papers resulting from research are published in appropriate journals thus ensuring wide dissemination of the information.

The Coastal Forests Research Programme

The coastal forests of Tanzania comprise small and geographically isolated forest remnants supporting large numbers of endemic and near-endemic plants and animals. The forests were once extensive but have been largely removed to provide timber and farmland. Their status, distribution and biological character were extremely poorly known. The Frontier-Tanzania Coastal Forest Research Programme was formed in 1989 with the aim of surveying these forests and describing their conservation importance. To date over 70 sites have been identified of which 15 have been studied in depth. For each study site the project produces vegetation maps, species lists of the plants, vertebrates and invertebrates, and studies of the ecology of key species. It is intended this information be used in the production of management plans to secure the sustainable future development of Tanzania's coastal forests.

Foreword to the Frontier Tanzania series of reports.

Global concern over the conservation of the world's biological diversity reached a new peak in June 1992, when many of the world's Heads of State signed the Biodiversity Convention in Rio de Janeiro at the Earth Summit (UNCED).

However, an accurate knowledge of the earth's biological richness is lacking in many countries. Without detailed information on the flora and fauna of a region its importance for the conservation of biological diversity remain undefined.

In Africa there are many areas of exceptional biological richness which have scarcely been studied. Even basic data on the status of resources may be lacking or outdated.

The Frontier-Tanzania project, a collaborative venture of the Society for Environmental Exploration and the Faculty of Science of the University of Dar es Salaam is tackling this problem head on.

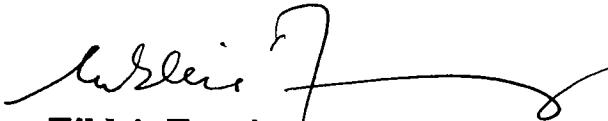

In 1989 Tanzanian scientists identified ecosystems in coastal Tanzania which were in particular need of study because of their biological richness and importance. Since that time, the Frontier-Tanzania project has provided the means and the man-power to investigate these sites, catalogue their importance and suggest management strategies for their conservation. Coastal monsoon forests, the coral reefs of Mafia Island, the mangroves and sediments of the Rufiji Delta, and the vegetation of the Mikumi National Park have been investigated over the past three years.

All of these projects have generated large quantities of new data on the biological importance of the sites and their place alongside similar systems elsewhere in Africa. This research has allowed biological-diversity priorities to be better determined and management actions to be suggested. Many of the recommendations are under consideration by the Tanzanian Government.

This report series forms a contribution to the Frontier-Tanzania project and to the knowledge of the biological diversity of Tanzania. We warmly endorse its publication and hope that many more reports and papers result from this collaborative project, and that they help to assure that the future of the biological heritage of these strategic sites is conserved.

INTRODUCTION

This document was compiled during October 1991 to July 1992 with the initial aim of producing a preliminary annotated species list of the vascular plants of the Coastal Forests of Tanzania, to provide a quick reference of the distribution and growth form of these plants for the benefit of ecologists and botanists working in these forests.

At that time knowledge of the Coastal Forests was very much less than it is now, and it was largely as a result of this work that it became apparent that, a) the Coastal Forests extend beyond White's Zanzibar-Inhambane regional mosaic, and, b) the size of the Coastal Forest flora is very much greater than was initially recognized.

In the last few years a number of other documents have been published which greatly increase our knowledge of the Coastal Forest flora, in particular the work of Robertson & Luke (1993) and Vollesen & Bidgood (1991). This document can be considered to be complimentary to these lists, and together they illustrate the need for a complete and detailed synthesis of an annotated Coastal Forest flora.

KEY TO THE SPECIES ANNOTATIONS

Column 1 : Plant Growth Form (PGF)

H	=	Herb
S	=	Shrub
B	=	Bush
C	=	Climber
L	=	Liana
T	=	Tree
G	=	Grass
ST	=	Small Tree

Column 2 : Habitat (HAB)

F	=	Forest
RF	=	Riverine Forest
FE	=	Forest Edge
WE Forest	=	Wet Evergreen Forest
W	=	Woodland
B	=	Bushland
T	=	Thicket
G	=	Grassland
S	=	Swamp and areas with high groundwater
Wa	=	Wasteland & Cultivation
R	=	Rocky habitats

Column 3 : Phytogeographical Distribution (DIS)

Z-I	=	Zanzibar-Inhambane Regional Mosaic
ZA	=	Zambesian Regional Centre of Endemism
AM	=	Afromontane Archipelago-like Centre of Endemism
G-C	=	Guinea-Congolia Regional Centre of Endemism
T-P	=	Tongaland-Pondoland Regional Mosaic
L-V	=	Lake Victoria Regional Mosaic
S-M	=	Somalia-Masai Regional Centre of Endemism
SUD	=	Sudanian Regional Centre of Endemism
KALA	=	Kalahari-Highveld Regional Transition Zone
MAD	=	Madagascar and/or Mascarene Phytogeographical Units

Widespread distributions are left blank.

Phytogeographical Units follow F. White (1983)

The vegetation of Africa
UNESCO, Paris.

Local distributions follow Milne-Redhill et al (1952) The Flora of Tropical East Africa

SPECIES LISTS

ACANTHACEAE	PGF	HAB	DIS
<u>Asystasia gangetica</u> (L.) Anders (syn <u>A. multiflora</u>)	H	Not forest,G,Wa	n/a

NOTES

The plant phytogeography, growth form and habitat requirement of the 13 Tanzanian Coastal Forests is based on data from Frontier collections in the Kiwengoma, Kiono (Zaraninge), Mlola (Mafia Island), Pande and Mchungu Coastal Forests which have been identified by Dr. K. Vollesen at the Royal Botanic Garden, Kew. Supplementary data has been added from the Hawthorne (1984) collections in Msubugwe, Gendagenda, Pugu, Vikindu, Pande and Kisiju Forests and also from remnant forest patches at the Amboni, Bushiri and Mwera Sisal Estates. Subsequent collections by Frontier at Gendagenda, Msubugwe and Kazimzumbwi Forests have resulted in about an extra 100 species which have yet to be included in the sample. It should be noted that only the Kiwengoma (366sp.), Kiono and Pugu inventories were anywhere close to being representative of the total floras present in these Coastal Forests.

The species lists have been annotated with the aid of all hitherto published volumes of the Flora of Tropical East Africa (Milne-Redhead et al., 1952-), some of the earlier volumes of Flora Zambesiaca (Exell & Wild, 1960-) and all editions of the Kew Bulletin from 1970 to the present. Other useful references have been Iversen (1991), Haines & Lye (1983), Hamilton & Benstead-Smith (1989), Vollesen (1980) & White (1988). Where insufficient information was still unavailable, herbarium records at the University of Dar es Salaam were checked.
